

A nonprofit home for Tech ID 30159

Neuromind Institute proposes to license the Vawter-lab diagnostic and therapeutic for schizophrenia and bipolar disorder from UCI - and carry it to the patients who need it.

Presented to UCI Applied Innovation - Research Translation

Attn: Patricia Chan, PhD, Licensing Officer - UC Case 2018-522-0 / Tech ID 30159

Dr. Marquis Vawter, Scientific Lead - Ken Mages, CTO

Psychiatry still diagnoses by observation, not biology

- Distinguishing schizophrenia from bipolar I takes a longitudinal clinical impression - on average about six months of observation.
- Every month of untreated psychosis carries measurable neuro-structural loss. The diagnostic delay is not neutral; it is the injury.
- Without an objective signal, patients are routed by bed availability, not biological need.

~6 mo

Average delay to a confident
schizophrenia vs. bipolar I diagnosis

~1%

Adult prevalence of schizophrenia
(about 2.8M US adults)

Two assets in one disclosure - from our own scientific lead

DIAGNOSTIC

18-gene blood biomarker panel

83-88% accuracy differentiating schizophrenia, bipolar I, and healthy controls from a blood draw. Validated on 90 subjects across two visits; schizophrenia-vs-bipolar AUC of 0.998.

THERAPEUTIC

Transcription-factor target

The same proto-oncogene transcription factors - elevated in bipolar, reduced in schizophrenia - are proposed as single-agent or combination therapy. Diagnosis and treatment from one mechanism.

- Invented by Dr. Marquis Vawter, who leads Neuromind's science. Distinct from the diagnostic patent already assigned to Laguna Diagnostics (US11713486B2).

The inventor is on the team, and the tool already runs

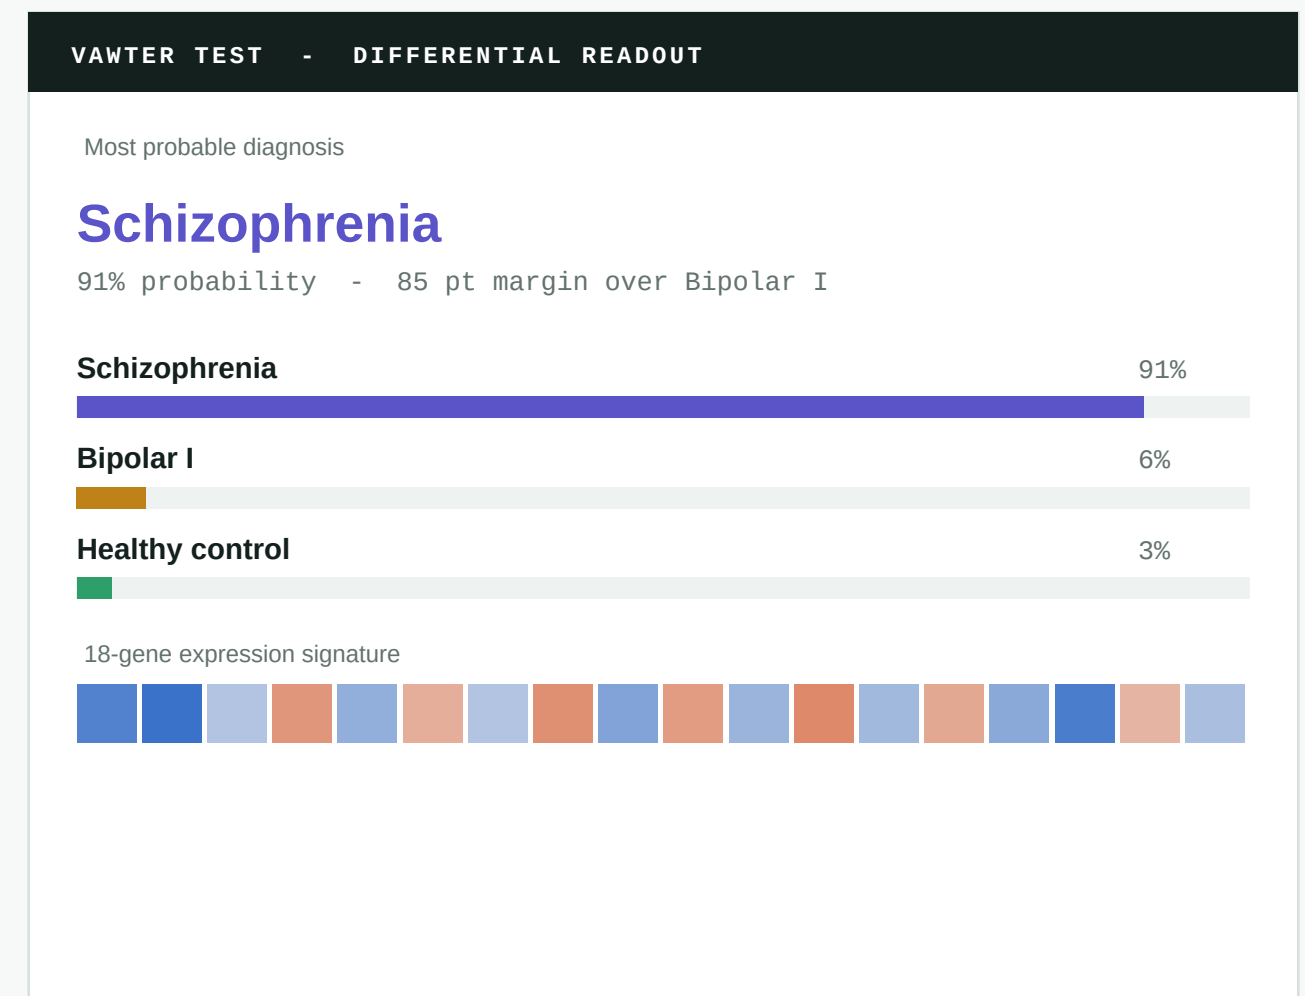

- Dr. Vawter is our Scientific Lead - the deepest possible command of the panel and its biology sits inside the licensee, not across a negotiating table.
- A working prototype of the diagnostic already exists, demonstrating the classifier end to end - proof of execution, not just intent.
- As a 501(c)(3), Neuromind's incentives are aligned with reach and access, not an equity exit - a mission-fit steward for a public-good diagnostic.

The Vawter Test: a working classifier, not a slide

Enter an 18-gene expression signature and the prototype returns a schizophrenia / bipolar I / control differential in seconds, with the genes driving the call. It is the clinical workflow, demonstrable today.

Try the live prototype - any browser, no login:

A nonprofit built for reach, not exit

- Mission: bring objective psychiatric diagnosis to the point of care, with priority on the under-resourced emergency settings where the diagnostic delay does the most harm.
- Intended funding model: NIH and foundation grants and philanthropic support - development capital that does not demand an equity return.
- Any downstream revenue is reinvested in access and returned to UCI as royalties, keeping the license mission-aligned and sustainable.

A defined regulatory route, and value back to UCI

01

Retrospective validation

Benchmark the panel on longitudinal cohorts; shadow-deploy at pilot ER sites.

02

Blinded trial

Multi-center blinded validation against the clinical gold standard.

03

FDA de novo

First-in-class psychiatric diagnostic clearance.

04

Deployment

Partner ER networks; mission-priced for access, royalty-bearing to UCI.

- A license only creates value if a team can carry it through the clinic. The inventor and a working prototype put Neuromind at the front of that line.

Who is behind Neuromind Institute

Dr. Marquis Vawter

Scientific Lead. Inventor of Tech ID 30159; developed and validated the 18-gene panel and the transcription-factor therapeutic hypothesis.

Ken Mages

CTO. Built the Vawter Test prototype and leads technology and product; drives Neuromind's path from license to deployed tool.

Assembling clinical and regulatory advisors to support validation and the FDA pathway as Neuromind scales.

What we would like to discuss with UCI

NEAR TERM

An option agreement on Tech ID 30159 - a defined evaluation period to complete diligence and stand up the program.

TARGET

An exclusive license in a field of use covering psychiatric emergency diagnostics and the associated therapeutic.

NONPROFIT

Socially-responsible license terms fitting a 501(c)(3) - structured for access and public benefit rather than maximized fees.

RESEARCH

A sponsored research pathway with the UCI lab to advance the panel toward a point-of-care ER form factor.

The questions we want to resolve up front

RIGHTS

How does Tech 30159 relate to the diagnostic patent already assigned to Laguna Diagnostics (US11713486B2)? Is the licensable scope free of Laguna's existing rights?

PATENT

Current filing status and claim scope of UC Case 2018-522-0 - issued, pending, or provisional - and the territories covered.

FIELD

Any existing options, licenses, or field-of-use carve-outs we should design around.

- We would rather surface these now than after a term sheet. Clarity here defines what a clean license actually looks like.

Let's put this diagnostic where patients arrive

We propose a 30-minute call to review diligence items and outline an option agreement on Tech ID 30159.
